

Question:2

1000 Company Proposal

Objective

If selected for the internship, my goal would be to build a high-quality list of 1,000 Federer companies within one month. Instead of collecting a large number of random company names, I would focus on finding companies that genuinely match DeepThought's ideal customer profile and have clear evidence supporting their qualification.

Week 1 – Building the Initial Company Universe

I would begin by collecting companies from multiple reliable sources rather than depending on a single database. Sources such as LinkedIn, Aero India Exhibitor Directory, SIDM, Invest Karnataka, DSIR-recognized R&D lists, EEPC India, IndiaMART, Tracxn, Tofler, and MCA filings would be used.

At this stage, the goal would be quantity. I would aim to create a master list of approximately 8,000–10,000 companies across manufacturing and specialized industrial sectors.

Expected output: 8,000–10,000 companies.

Week 2 – Applying Eligibility Filters

The next step would be filtering companies using the E1 and E2 criteria.

First, I would remove traders, distributors, resellers, consulting firms, software-only companies, and service providers that do not have operational infrastructure.

Second, I would verify that the company has a meaningful operational presence in India through manufacturing facilities, R&D centres, engineering offices, or production units.

This stage would significantly reduce the list but improve quality.

Expected output: around 3,000–4,000 companies.

Week 3 – Federer Scoring

For the remaining companies, I would evaluate the six Federer criteria (C3–C8).

I would use company websites, leadership profiles, annual reports, news articles, job postings, LinkedIn activity, and company databases to gather evidence.

AI tools could help summarize information and identify patterns, but every score would be supported by actual evidence.

Companies showing strong differentiation, growth signals, leadership depth, and systems maturity would receive higher priority.

Expected output: approximately 1,500–2,000 companies.

Week 4 – Manual Review and Quality Control

The final week would focus on verification.

I would manually review high-scoring companies to remove false positives, duplicate entries, acquired businesses, PE-controlled firms, and companies outside the target revenue range.

Borderline cases would be checked using additional sources before making a final decision.

The objective would be to ensure that the final list contains companies that DeepThought's sales team can realistically approach.

Expected output: 1,000 qualified Federer companies.

Quality Control Process

To maintain accuracy, I would cross-check important information using multiple sources whenever possible. Revenue, leadership information, ownership structure, and operational presence would be verified before final inclusion.

For companies with incomplete information, I would mark them separately for manual review rather than making assumptions.

Expected Funnel

10,000 Companies Identified

↓

4,000 Companies after E1 and E2 Filters

↓

2,000 Companies after Federer Scoring

↓

1,200 Companies after Manual Validation

↓

1,000 Final Qualified Companies

Conclusion

My approach would combine large-scale sourcing, structured filtering, AI-assisted research, and manual verification. The focus would not be on generating the largest list possible but on creating a reliable list of companies that genuinely fit the Federer profile and are worth DeepThought's outreach effort.
